For Verification

For Liveness JS

For Fingerprint

Requirements

Device

- Device must have a front-facing camera
- Minimum refresh rate of the device display: 60 Hz
- Minimum display or screen size: 4 inches
- Device should not be jail-broken or rooted

Camera Specification

- Color Camera: front-facing camera should be able to record colors.
- No virtual camera or camera software.
- Minimum recording capability: 15 frames per second.
- Minimum video recording resolution: 480x640px.
- When users use a webcam with a desktop for a Face Liveness check, it is important to mount the webcam on top of the same screen where the Face Liveness check starts.

Internet

- Stable internet (100kbps+)

To get your `face_liveness_session_id` you need to do a liveness check.

Integrate liveness check to your website by adding this script.

```
<script src="https://liveness.verify.gov.ph/js/verify-liveness-sdk.min.js"></script>
```

Start liveness by calling the function `eKYC().start(options)` .

Function Name	Description
start (<i>options</i>)	Promise<{ status: COMPLETED CANCELLED, result: JSON_OBJECT }>

Options	
pubKey	This is your System Application's Public API Key

Example HTML File:

```
<html>
<body>
  <div>
    <button onClick="startLiveness();">Start Liveness</button>
    <pre id="response"></pre>
  </div>
  <script src="https://liveness.verify.gov.ph/js/verify-liveness-sdk.min.js"></script>
  <script>
    function startLiveness() {
      window.eKYC().start({
```

```
    pubKey: {{YOUR_PUBLIC_API_KEY}}
  }).then((data) => {
    const el = document.getElementById('response');
    el.textContent = JSON.stringify(data, undefined, 2);
  }).catch((err) => {
    console.log('error', err);
  });
}
</script>
</body>
</html>
```

SDK reponse:

```
{
  "status": "COMPLETED",
  "result": {
    "photo": "..."
    "session_id": "a1b3fae6-af74-4896-bd58-32a81604de01",
    "photo_url": "https://liveness.photo.url/image.jpg/?expires=some-
expiration",
  }
}
```
